Support Services

Overview

Dytecna originated in 1947 and from inception has demonstrated expertise in engineering with the selection and procurement of military and off-the shelf equipment for integration into a wide range of bespoke systems – installed into tracked and wheeled vehicles, static and air-portable containers or other mediums to suit special roles and environments.

In recent years this expertise has expanded to include the design and manufacture of training and simulation hardware, protection devices and equipment (including ballistic and electronic force protection systems) and conditioning monitoring and power distribution solutions for complex systems.

Today, as a leading independent engineering solutions, technology systems and support services company, Dytecna continues to deliver to its traditional customer base and is also bringing engineering innovation to other technologically advanced sectors.
